

Please answer questions below and return to LakeLand Village Water by 8/1/2024

A cross connection exists whenever the drinking water system is or could be connected to any nonpotable source (plumbing fixture, equipment used in any plumbing system, sprinkler system). Pollutants or contaminants can enter the safe drinking water system through uncontrolled cross connections when backflow occurs. Backflow or backsiphonage may occur during waterline breaks, when repairs are made to the waterlines, when shutting off the water supply, etc. Backpressure can occur when the potable water supply is connected to another system operated at a higher pressure or has the ability to create pressure. Principal causes are booster pumps, pressure vessels and elevated plumbing.

A Water Use Questionnaire: We need 100% participation as this will ensure safe drinking water for everyone in the village. We will evaluate the questionnaires to assess the risk of contamination and contact those who will need to have backflow prevention assemblies.

Thank you for your compliance.
